San Gabriel Valley Groundwater Cleanup Superfund Progress Report

U.S. Environmental Protection Agency • Region 9 • San Francisco, CA • January 2014

Cleanup of the Valley's Soil and Groundwater Continues

More than 100 billion gallons of groundwater treated; $300 million spent on cleanup

The U.S. Environmental Protection Agency (EPA) continues to make significant progress in the decades-long effort to clean up groundwater pollution in the San Gabriel Valley. Eleven groundwater treatment systems are operating as part of the Superfund cleanups – in Baldwin Park; El Monte; South El Monte; and the Whittier Narrows area – with five additional systems planned or in construction. Most systems operate as joint cleanup and water supply projects, supplying clean drinking water to area residents. Since 2002, the 11 projects have treated more than 100 billion gallons of contaminated water and removed more than 70,000 pounds of contaminants from the groundwater. Targeted cleanups of industrial facilities have removed another 50,000 pounds of contaminants from the soil.

Through agreements that EPA has negotiated with Potentially Responsible Parties (PRPs), and EPA enforcement orders, PRPs have paid more than 300 million dollars for cleanup. Additional funds have been provided by the EPA, Congressionally-earmarked federal funds, the State of California, and local ratepayers. Another 200 million dollars will probably be spent on the cleanup over the next 10 years.

The Valley's Drinking Water

The San Gabriel Basin aquifer is the primary source of drinking water for over one million residents in the San Gabriel Valley. Local water utilities continue to supply high quality groundwater from the San Gabriel Basin to residents and businesses in the Valley. In areas affected by the contamination, water utilities have closed contaminated drinking water supply wells and continued to provide their customers with clean water by using treated water from EPA cleanup projects, installing wellhead treatment systems, obtaining water from unaffected parts of the basin, and using imported water. Drinking water supplies are regularly tested to make sure that they meet federal and state drinking water standards.

EPA, State, and local cleanup efforts are protecting the underground water from further degradation and continuing the decades-long process of removing potentially harmful chemicals from contaminated portions of the aquifer.

Key Accomplishments

Whittier Narrows Operable Unit (OU)*

An EPA-built water treatment system continues to operate, protecting the drinking water supply for more than two million Los Angeles residents.

Baldwin Park OU

Four large water treatment systems continue to operate, cleaning the groundwater and providing drinking water to about 100,000 homes in the San Gabriel Valley.

South El Monte OU

Four water treatment systems continue to operate, cleaning the groundwater and providing drinking water to about 50,000 homes in the San Gabriel Valley.

El Monte OU

Two water treatment systems continue to operate; construction of two additional systems is underway.

Puente Valley OU

Design of the water treatment systems is underway, with construction of new water treatment facilities expected to start in late 2014 and continue through 2017.

Area 3 OU

Testing is now complete, with a proposed groundwater cleanup plan expected in 2015.

**EPA divides large or complicated cleanups into multiple "operable units."*

Sources of Contamination

The groundwater contamination is the result of decades of poor chemical handling and disposal practices by hundreds of industrial facilities. Most of the activities that led to the contamination probably occurred between the 1940s and 1970s, before the Superfund program was established and other environmental laws were adopted.

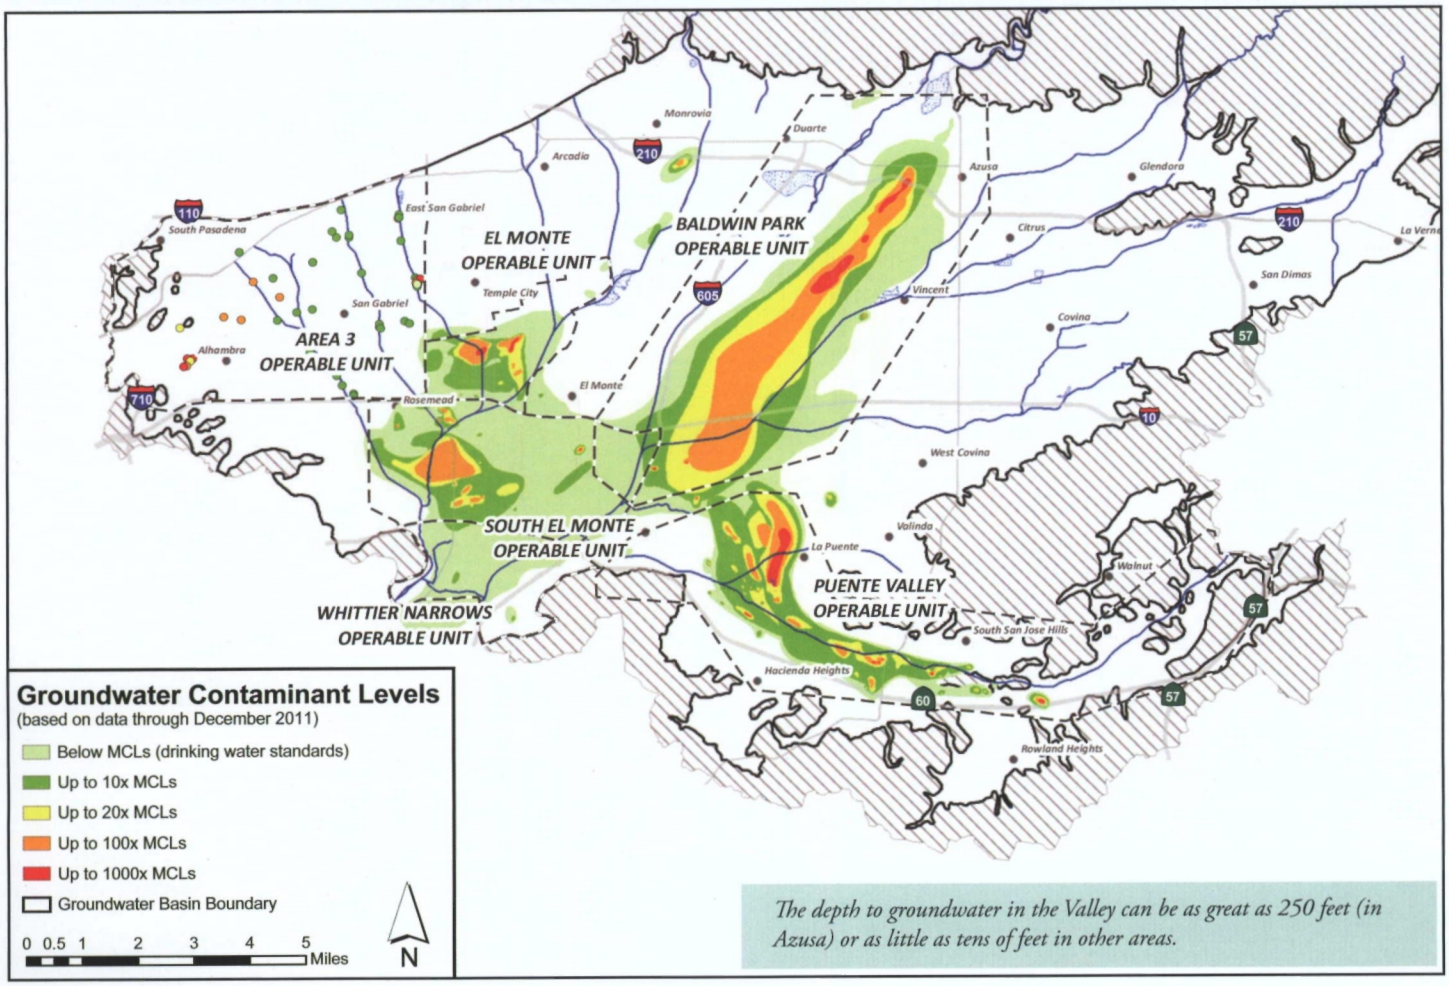

Figure 1: *Approximate Extent of Groundwater Contamination, EPA Cleanup Projects in the San Gabriel Valley*

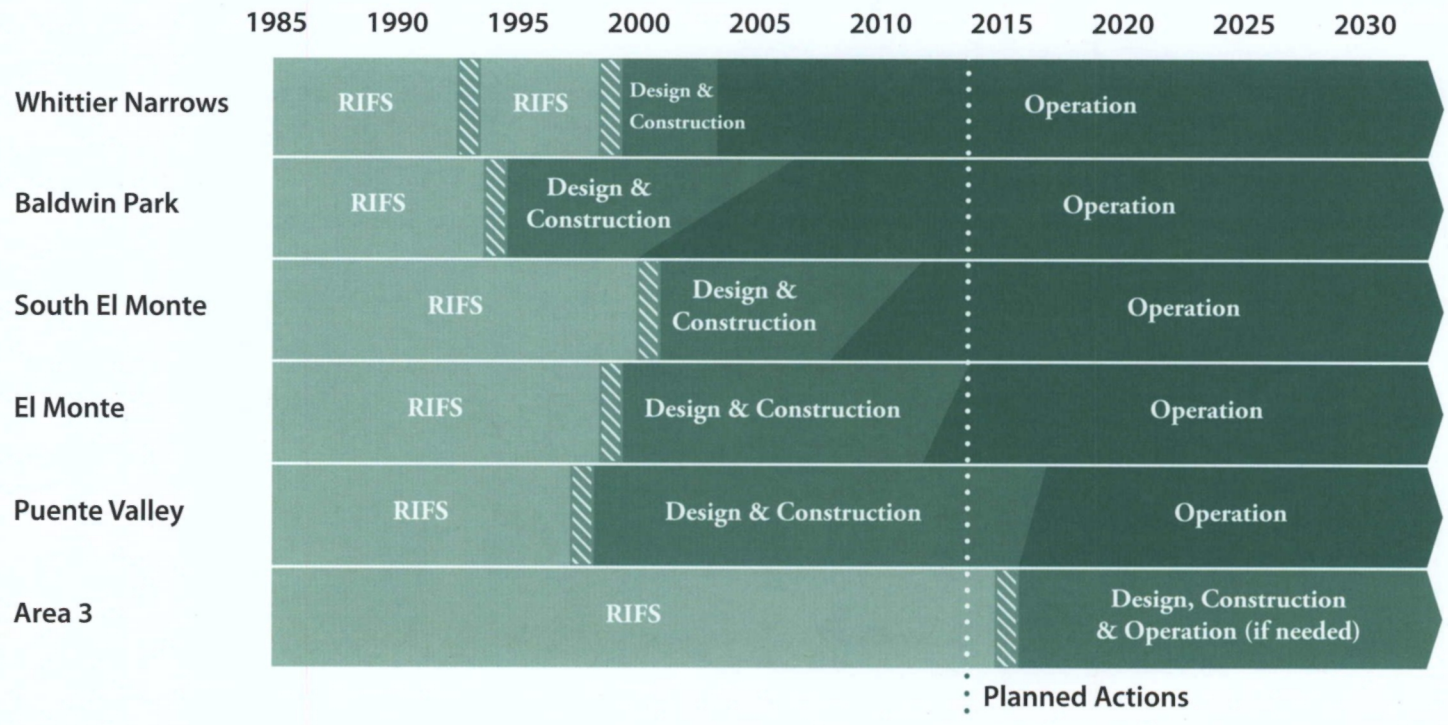
A Brief History

In 1979, multiple areas of contamination in the San Gabriel Valley's massive underground water supply were discovered when the State mandated testing of local drinking water supplies. In 1984, EPA added four areas of groundwater contamination to the Superfund "National Priorities List" and began a multiyear effort to understand the sources, nature and extent of the groundwater contamination. Initially, the focus was on the presence of solvents, such as trichloroethylene (TCE) and perchoroethylene (PCE), in the soil and groundwater. Later, additional contaminants, such as a rocket fuel constituent called perchlorate were identified in some areas. Between 1993 and 2000, EPA adopted initial cleanup plans for most of the contaminated areas in the Valley. Over the last decade, EPA has negotiated agreements with PRPs to carry out or pay for most of the cleanups. By 2001, construction of the groundwater extraction and treatment facilities needed as part of the cleanup began. Additional details on the status of the cleanup in each of the areas of contamination is provided below.

Who is Responsible for Overseeing Cleanup?

EPA is responsible for overseeing cleanup in five of the six areas described in this fact sheet. Responsibility for the Whittier Narrows cleanup was recently transferred from EPA to the State of California. The PRPs are paying the majority of the cleanup costs and local water utilities are operating most of the water treatment systems. State and local water agencies, including the Los Angeles Regional Water Quality Control Board, the California Department of Toxic Substances Control (DTSC), the Main San Gabriel Basin Watermaster, and the San Gabriel Basin Water Quality Authority, also play important roles in the cleanup. Read on for more details.

San Gabriel Valley Cleanup – Progress and Plans



RIFS – Remedial Investigation and Feasibility Study (i.e., groundwater testing and engineering analyses)

– EPA Record of Decision (i.e., cleanup plan)

Five-Year Review: EPA regularly reviews progress made at each of the cleanup projects. Formal reviews are completed every five years. Five-year reviews have been completed at the Whittier Narrows (2006 and 2011), Baldwin Park (2007 and 2012), Puente Valley (2011), and the South El Monte cleanups (2013).

Whittier Narrows

Where is it?

The Whittier Narrows OU addresses groundwater contamination in the southernmost part of the San Gabriel Valley, where groundwater and surface water flow from the San Gabriel Basin into the Central Basin.

What are the primary contaminants of concern?

PCE.

What is the status of cleanup efforts?

EPA adopted a cleanup plan for the Whittier Narrows area in 1993, and amended the plan in 1999. In accordance with the plan, EPA completed construction of a $12 million groundwater treatment system in 2002. The plant included seven ground water extraction wells, pipelines, and 20 pairs of granular activated carbon (GAC) water treatment vessels. Since 2002, more than 22 billion gallons of water have been treated and thousands of pounds of contaminants removed from the groundwater. As the levels of contamination have decreased, EPA has modified the cleanup systems, reducing the number of active groundwater extraction wells from seven to three, and the number of active GAC vessel pairs from 20 to 10.

Whittier Narrows Operable Unit Water Treatment System

The City of Whittier operated the treatment facility from November 2004 until May 2013, supplying the treated groundwater to residents and businesses in Whittier, and to Legg Lake in the Whittier Narrows Recreation Area. In May 2013, the California DTSC took over responsibility for operation of the remedy and entered into a contract with the San Gabriel Valley Water Company (SGVWC) to operate the treatment plant.

Who is paying for cleanup? What will it cost?

More than $22 million has been spent to date on the Whittier Narrows cleanup. EPA has paid more than $20 million; the California DTSC has paid $2.5 million. The annual cost of operating the cleanup facilities has ranged from about $0.5 to $1 million. The total cleanup cost is estimated to be $50 million.

What's next?

In the next year, EPA will complete approximately $5.5M in improvements, which will include a new water storage tank, pump station, and disinfection equipment. The California DTSC will be responsible for 10% of the cost of the new construction and all operation and maintenance costs. Once EPA completes the improvements, DTSC will enter into a contract with SGVWC, to continue operations and supply a portion of the treated water to SGVWC's customers.

Baldwin Park

Where is it?

The Baldwin Park OU addresses groundwater contamination underlying portions of the cities of Azusa, Irwindale, Baldwin Park, West Covina, La Puente, and City of Industry. The area of contamination is approximately 10 and one-half square miles.

What are the primary contaminants of concern?

TCE, PCE, carbon tetrachloride, perchlorate, NDMA, 1,2,3-trichloropropane (1,2,3-TCP), and 1,4-dioxane.

What is the status of cleanup efforts?

EPA adopted a cleanup plan for the Baldwin Park area in 1994, and updated the plan in 1999. Four large groundwater extraction and treatment projects were built between 2000 and 2006 at a cost of more than $100 million. The projects are operated by local water utilities, supplying clean treated water to local homes and businesses. The systems consist of ground water extraction wells, monitoring wells, pipelines, and multiple water treatment processes for removal of contaminants. From 2002 to 2012, more than 69 billion gallons of water were treated and 59,000 pounds of contamination removed from the ground water. The projects are currently treating over 25 million gallons of water per day and removing between 5,000 and 10,000 pounds of contamination per year, and are capable of supplying water to more than 100,000 homes. Improvements are underway, including replacement of the perchlorate removal equipment to increase the reliability of the water treatment systems.

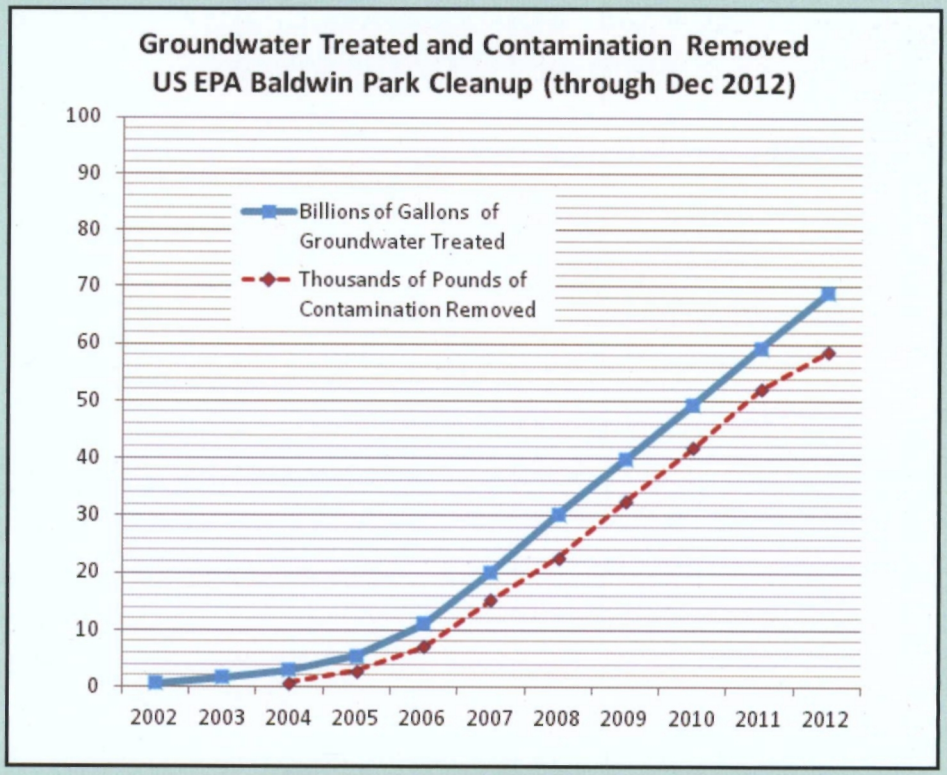
Between 2000 and present, soil cleanup work was also completed at five industrial properties in the Baldwin Park OU, removing tens of thousands of pounds of contaminants from the soil and soil gas. This work has been overseen primarily by the Los Angeles Regional Water Quality Control Board.

Who is paying for cleanup? What will it cost?

PRPs are funding a majority of the work in compliance with a June 2000 EPA Order. More than $200 million has been spent on the four cleanup projects to date, with annual operation and maintenance costs of approximately $16 million per year. Federal and state grants have contributed more than $38 million to the cleanup. The estimated total project cost is $500 million.

What's next?

EPA will oversee upgrades to the water treatment systems. Monitoring of progress toward EPA's cleanup goals will continue, with annual performance evaluation reports published each spring.



Groundwater cleanup in the Azusa/Baldwin Park area

South El Monte

Where is it?

The South El Monte Operable Unit (SEMOU) addresses approximately two and one-half square miles of contaminated groundwater underlying portions of the cities of South El Monte, El Monte, and Rosemead.

What are the primary contaminants of concern?

PCE.

What is the status of cleanup efforts?

South El Monte Operable Unit Water Treatment System

EPA adopted a cleanup plan for the South El Monte area in the year 2000, and updated the plan in 2005. The cleanup currently uses eight groundwater extraction wells and four water treatment systems that remove PCE and TCE from the groundwater. EPA began funding operation of the treatment systems in 2008. After treatment, the groundwater is distributed by local water utilities to residents and businesses in the area.

Over the last five years, the project has treated more than 15 billion gallons of contaminated water and removed more than 7,000 pounds of contaminants from the aquifer. EPA conducted a Five Year Review of the SEMOU in 2013. See page 3 for more details on the five-year review process.

Who is paying for cleanup? What will it cost?

EPA has negotiated settlements with more than 40 PRPs to provide funds for the cleanup. PRPs have paid a large portion of the cost of cleanup, with additional funds provided by EPA, the State of California, and the San Gabriel Valley Water Quality Authority. The total project cost is estimated to be $75M.

What's next?

EPA is evaluating the need for additional cleanup at the SEMOU. As part of the evaluation, EPA installed new groundwater monitoring wells in 2012 and 2013 and is now analyzing the results. EPA is also collecting soil gas and indoor air samples to evaluate the potential for vapor intrusion at the site. A report summarizing the results of the testing is expected in 2014; a feasibility study evaluating the need for additional cleanup is planned for 2015.

El Monte

Where is it?

The El Monte Operable Unit (EMOU) addresses an area of groundwater contamination underlying portions of the cities of El Monte, Rosemead, and Temple City. The contamination covers an area of approximately one and one-half square miles.

What are the primary contaminants of concern?

PCE and TCE.

What is the status of cleanup efforts?

EPA adopted a cleanup plan for the El Monte area in 1999, and updated the plan in 2002. Four water treatment systems have been or will be constructed as part of the cleanup. The first two systems, known as the West Side OU, have been constructed and are operating. They include a treatment system constructed by a local water utility, and a recently constructed plant targeting the more contaminated shallow groundwater. The west side systems supply drinking water to El Monte area residents and discharge treated water to the Eaton Wash.

Construction of the third and fourth water treatment systems, known as the East Side OU, is underway. Seven groundwater extraction wells have been installed, and construction of two water treatment plants and pipelines started in September 2013.

Who is paying for cleanup? What will it cost?

PRPs are paying the majority of the cost, in accordance with a 2004 EPA Consent Decree. The total project cost is estimated to be $50 million.

El Monte Operable Unit Water Treatment System

What's next?

The West Side treatment plants will continue to operate. Construction of the East Side plants should be complete in late 2014.

Puente Valley

Where is it?

The Puente Valley Operable Unit (PVOU) addresses groundwater contamination underlying portions of the cities of Industry and La Puente, and unincorporated Los Angeles County. The area of contamination is approximately five square miles.

What are the primary contaminants of concern?

PCE, TCE, 1,1-dichloroethene (1,1-DCE), and 1,4-dioxane.

What is the status of cleanup efforts?

Initial cleanup work at the site began in the 1980s, when groundwater cleanup systems operated at two locations under State oversight. Soil cleanup has also been completed at many industrial sites under State oversight.

EPA adopted a groundwater cleanup plan for the Puente Valley area in 1998, and updated the plan in 2005. Four groundwater cleanup projects will be constructed as part of the cleanup. At the first cleanup project, known as the "Shallow Zone-North" cleanup, construction of a network of 10 groundwater extraction wells was completed in 2007. The project will clean up contaminated shallow groundwater north of Puente Creek. Construction should resume in 2014 and be complete by 2017, after additional monitoring wells are installed and agreements are reached for discharge of the treated water.

Well Drilling Rig

Design and construction of the second project, known as the "Intermediate Zone" cleanup, should be complete in 2015. This project will clean up deeper, less contaminated groundwater. The third and fourth projects are scheduled for construction in 2016. They will further clean up highly contaminated shallow groundwater south of Puente Creek.

Who is paying for cleanup? What will it cost?

Two PRPs are responsible for funding cleanup work in compliance with two Consent Decrees and a 2011 EPA Order. Other PRPs have contributed funds toward the cleanup. The total cost of the remedy is estimated to be $75 million.

What's next?

Additional groundwater monitoring wells will be installed and sampled in 2014. Efforts to complete arrangements for use or discharge of the treated water will continue, and construction of all four cleanup projects should be complete by 2016.

Area 3

Where is it?

The Area 3 investigation area includes pockets of groundwater contamination in a 19 square mile area that includes portions of the cities of Alhambra, Rosemead, San Gabriel, San Marino, South Pasadena, and Temple City.

What are the primary contaminants of concern?

TCE, PCE and 1,2,3-TCP.

What is the status of cleanup efforts?

Since 2008, the City of Alhambra has operated a water treatment plant to remove TCE, PCE and 1,2,3-TCP from the drinking water supply.

To identify the sources of the groundwater contamination and determine what additional cleanup is needed, the State of California has directed and overseen investigations of more than 20 current and former industrial facilities. EPA supplemented these investigations with 10 new ground water monitoring wells and soil testing at four industrial facilities identified as possible sources of groundwater contamination. EPA is using the data generated by these investigations to identify and evaluate groundwater cleanup options.

Who is paying for cleanup? What will it cost?

Property owners paid for testing at most of the industrial facilities. EPA has paid for the regional groundwater investigation and technical evaluations completed to date.

What's next?

In 2015, EPA expects to complete a feasibility study and develop a proposed soil and groundwater cleanup plan. EPA's proposal will include an estimate of the cleanup cost. EPA will hold a public meeting to take comments and hear community concerns on its proposal. EPA also plans additional soil testing at one of the four industrial facilities where testing occurred in 2013.
